X DATA

XData Competitive & Clinical Intelligence Agent

Know what changed, whether it matters to your drug, and the evidence behind every fact

- Monitors live sources
- Scores impact on your drugs
- Shows the evidence

rathi.dasgupta@gmail.com

Competitive intelligence teams are buried in source updates

Too much to watch

Thousands of trial records, papers, labels and filings change every week across separate sites.

Signal hides in the noise

A changed primary endpoint looks the same as a typo fix until someone reads both versions.

Slow to reach leadership

Analysts spend days finding, checking and writing up a change before an executive hears about it.

AI answers you can't trust

Generic chatbots mix facts with guesses and rarely show where a claim came from.

How it works: from a source update to a decision-ready alert

1. Monitor

ClinicalTrials.gov, PubMed, FDA labels and approvals, SEC filings, company news

2. Detect

Compares versions field by field; ignores formatting-only edits

3. Map

Links each change to your drugs by target, disease, line of therapy and biomarker

4. Score

Importance score 0-100 from five explained factors

5. Explain

Summary where every fact cites its source; guesses labelled as such

6. Deliver

Alerts, executive briefs and Ask-a-question, with exports to Word, PDF and PowerPoint

Example: one trial update becomes an Executive Alert

What changed in trial NCT99000001 (competitor drug CA-201)

Field	Before	After
Enrollment target	320	**480 (+50%)**
Primary completion	Jun 2027	**Nov 2027 (5 months later)**
Primary endpoint	Objective response rate	**Progression-free survival**

Why it matters to you: CA-201 competes with your drug XD-101, sharing target, disease, line of therapy and biomarker (100% similar).

Suggested next step: review the sponsor's investor materials for the rationale (the source does not say why).

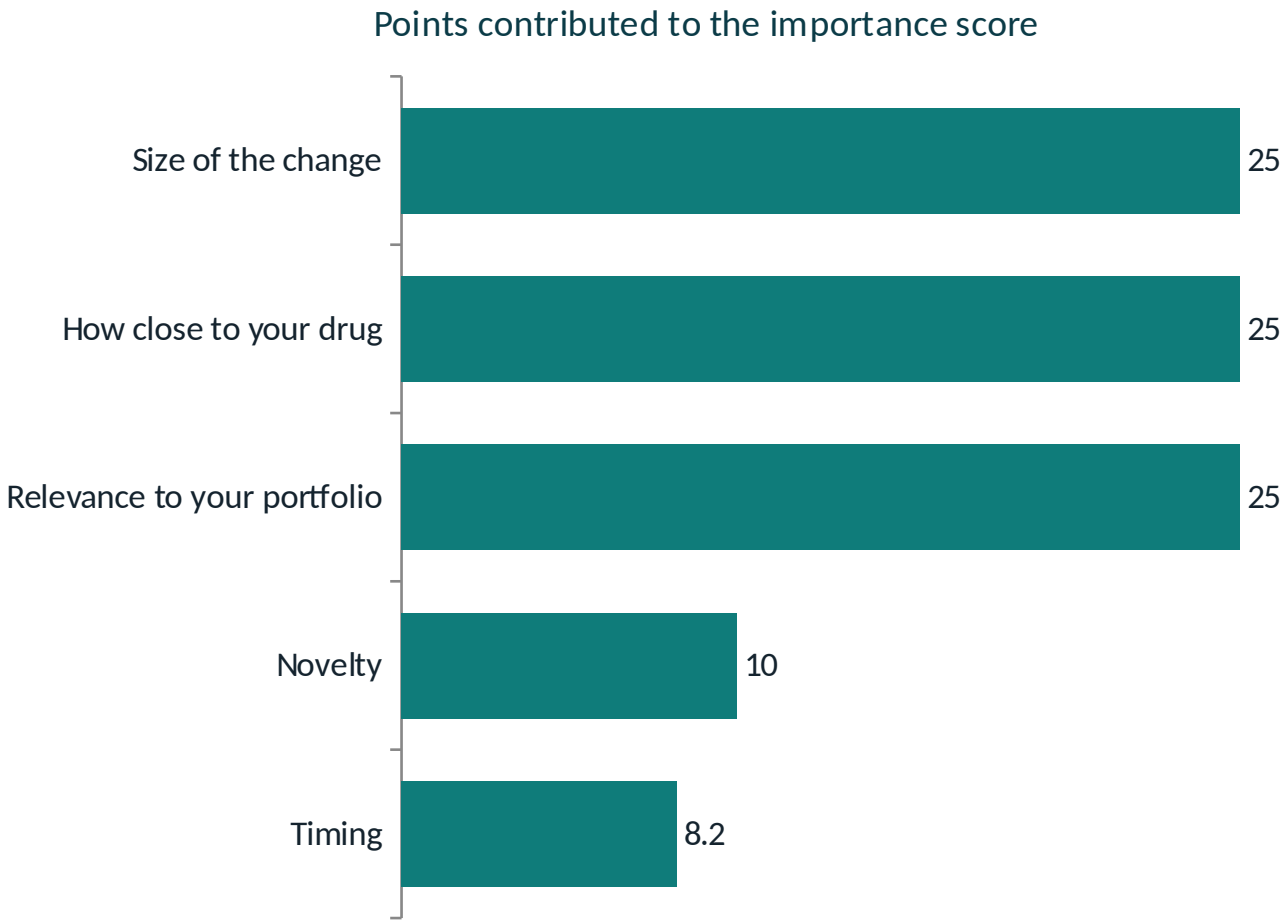

93

Importance score out of 100

Executive Alert

Mapped automatically to XD-101 with the path: XD-101 competes with CA-201, which is being tested in NCT99000001

Every score explains itself: the 93 points, factor by factor

Computed, not invented

Explanations come from the same numbers that produced the score.

What would change it

"Drops out of Executive Alert if the score fell 8.3 points."

What it doesn't know

Stale sources, unknowns and indirect comparisons are always shown.

AI that cites its sources and says "I don't know"

Every statement carries one of four labels

Verified fact — Backed by the cited source; numbers, dates and IDs checked automatically

AI interpretation — A hypothesis, clearly labelled and hedged; never shown as fact

Not known yet — What the evidence does not establish

Suggested next step — Where to look to close the gap

How answers are grounded

- Retrieves passages three ways (meaning, keywords, linked drugs) and merges them
- Claude writes only from the retrieved evidence, tagged S/C/E by source type
- An independent checker re-verifies each fact; unsupported facts are withheld
- A serious failure blocks the AI text and publishes a facts-only version instead
- Every AI call is logged: model, prompt version, evidence used, cost

Built for production, not a prototype

156

automated tests
(110 backend, 46 web)

12 / 12

quality metrics pass
the release gate

123

documented API
operations

Security

Tenant isolation enforced in the database, SSO and role-based access, encrypted credentials

Audit

Tamper-evident activity log; every raw source document kept unchanged with its checksum

Run anywhere

One-command Mac install, one-click cloud, or Kubernetes on AWS with Terraform

Get started in three steps

X DATA

1. Install

Paste one command in Terminal on a Mac. No Docker or admin rights; opens in your browser in about 5 minutes.

2. Add your drug

Describe target, disease, line of therapy and biomarker. Every competitor change is scored against it.

3. Tune what it watches

Set the trial, PubMed and FDA searches; add a Claude API key for AI-written summaries.
